1       TITLE OF THE INVENTION

2           Isotopically Labelled Fatty Acids

3       ABSTRACT OF THE DISCLOSURE

4           The present invention relates to a process for  
5       the preparation of specifically labelled fatty acids and  
6       particularly to certain tetradeuterated or trideuterated  
7       palmitic acids. The novel compounds of the present invention--specifically labelled palmitic acids including palmitic-5,5,6,6-d<sub>4</sub> acid, palmitic-7,7,8,8-d<sub>4</sub> acid, palmitic-10,16,16,16-d<sub>3</sub> acid, and palmitic-11,11,12,12-d<sub>4</sub> acid--are  
11       prepared by a synthetic scheme which involves a combination  
12       of steps, including the alkylation of an intermediate  
13       containing a terminal acetylenic moiety and subsequently  
14       hydrogenating or deuterogenating the acetylenic bond in  
15       the presence of the soluble hydrogenation catalyst, tris-  
16       (triphenylphosphoro)rhodium chloride, to produce the  
17       corresponding saturated compound in which the acetylenic  
18       bond is saturated with either hydrogen or deuterium. Subsequent synthetic steps are utilized to convert functional  
20       substituents by known reaction steps to a carboxylic acid  
21       substituent, thus producing the novel compounds of the  
22       present invention.

-1-

23 SUMMARY OF THE INVENTION

24 This invention relates to a process for the prep-  
25 aration of specifically labelled, saturated fatty acids  
26 and to the process for the preparation of specifically  
27 labelled unsaturated acids. More specifically, it relates

1078865

1 to multi-step syntheses of fatty acids in which the syn-  
 2 thesis is designed to minimize the possibility of isotope  
 3 scrambling. The invention further relates to the novel  
 4 specifically labelled fatty acids prepared in accordance  
 5 with the novel processes. Still more specifically, it  
 6 relates to a group of novel specifically deuterated pal-  
 7 mitic acids. It also relates to a novel method for pro-  
 8 ducing such compounds by a synthesis which includes the  
 9 steps of (1) alkylating a compound having a terminal  
 10 acetylenic moiety and a terminal functional substituent  
 11 convertible to carboxyl, and (2) catalytically deutero-  
 12 enating the triple bond of the formed acetylenic compound,  
 13 thus producing an intermediate having only one carbon  
 14 carbon linkage completely deuterated and having substitu-  
 15 tally no deuterium substitution elsewhere in the molecule.

16 BACKGROUND OF THE INVENTION

17 The processes for producing labelled fatty acids  
 18 employed in the prior art involve the conversion of or-  
 19 dinary fatty acids to their deuterated counterparts by  
 20 hydrogen-deuterium exchange under conditions leading to  
 21 partial and/or complete replacement of hydrogen with deu-  
 22 terium in a statistical basis. This type of deuterium-

23 hydrogen exchange is difficult to control, and impossible  
 24 to limit to the preparation of specifically labelled fatty  
 25 acids. Other methods involve the preparation of mixtures  
 26 of partially deuterated fatty acids and the attempt to  
 27 separation of such mixtures into their component individual  
 28 compounds by complicated isolation procedures involving  
 29 gas-liquid chromatography and the like. Still other

1 procedures include the synthesis of unsaturated fatty  
2 acids and the catalytic deuteration of such unsaturated  
3 acids to produce the corresponding dideuteriosubstituted  
4 saturated fatty acids having deuterium present in at  
5 least one specific location in the molecule. A drawback  
6 to this procedure is the tendency to cause isotope scram-  
7 bling during the catalytic deuteration of such compounds.  
8 Thus, in the course of the catalytic deuteration of such  
9 compounds, one obtains, in addition to the product resul-  
10 ting from saturation of the double bond, a proportion of  
11 product in which other hydrogens of the substrate compound  
12 have randomly been exchanged with deuterium. This results  
13 in the preparation of a mixture of deuterated analogs,  
14 which either contaminate the specifically labelled product  
15 or which must be separated by difficult purification pro-  
16 cesses such as are mentioned hereinabove.

17 DESCRIPTION OF THE INVENTION

18 In accordance with the present invention, there  
19 is provided a process for the preparation of specifically  
20 labelled fatty acids using a synthetic sequence which  
21 combines the steps of alkylation of a terminal acetylenic  
22 substituent and hydrogenating or deuterogenating the acet-  
23 ylenic bond in the presence of a selective and soluble  
24 hydrogenation catalyst. The selection of the substrate  
25 compounds for the alkylation reaction is based on the  
26 desired position of deuterium in the final specifically  
27 labelled acid. This alkylation reaction establishes the  
28 position of the deuterium labelling relative to the carb-  
29 oxylic acid function in the final compound.

1                   The process of the present invention is espe-  
2                   cially useful for the preparation of specifically labelled  
3                   palmitic acids, which contain deuterium substituents spe-  
4                   cifically affixed to certain positions of the carbon  
5                   skeleton. Thus, by judicious selection of the reacting  
6                   species, there are prepared in accordance with the present  
7                   invention, palmitic-5,5,6,6-d<sub>4</sub> acid, palmitic-7,7,8,8-d<sub>4</sub>  
8                   acid, palmitic -16,16,16-d<sub>3</sub> acid, and palmitic-11,11,12,  
9                   12-d<sub>4</sub> acid. The process of the present invention may also  
10                  be utilized in the preparation of other specifically deu-  
11                  terated d<sub>4</sub> fatty acids, especially d<sub>4</sub> palmitic acids.

12                  In accordance with the present invention, the  
13                  starting materials employed include one compound containing  
14                  a terminal acetylenic moiety and a second compound con-  
15                  taining a terminal halogen substituent. The halo compound  
16                  is the alkylating species, and the number of carbons in  
17                  the halo hydrocarbon determines the length of the alkyl  
18                  substituent attached to the terminal acetylene group and  
19                  therefore the ultimate specific position of deuterium  
20                  atoms in the final acid. The starting material which con-  
21                  tains the terminal acetylene moiety also contains a carb-  
22                  oxylic acid function or another functional substituent  
23                  readily convertible to carboxyl but unreactive under the  
24                  conditions of the alkylation reaction. One such substi-  
25                  tuent is an hydroxyl substituent protected from reaction  
26                  by derivatization as a tetrahydropyranyl ether. Following  
27                  the alkylation, the tetrahydropyranyl ether is readily  
28                  cleaved to produce the corresponding hydroxy compound which  
29                  is carefully oxidized to the corresponding carboxylic acid  
30                  compound in two stages using pyridium chlorochromate.

1                   In another procedure, the hydroxyl substituent  
2    is first converted to a bromo substituent by treatment  
3    with a brominating agent such as carbon tetrabromide in  
4    the presence of triphenylphosphine, which in turn is meta-  
5    thesized with an alkali metal cyanide, e.g., potassium,  
6    to the corresponding nitrile. The nitrile compound is  
7    then converted to the corresponding carboxylic acid by  
8    hydrolysis with aqueous alkali, as for example, an alkali  
9    metal hydroxide (sodium or potassium hydroxide 20% solu-  
10    tion in water w/v).

11                  In one specific embodiment of the invention,  
12    the tetrahydropyranyl ether of 5-hexyn-1-ol is alkylated  
13    by treatment with 1-bromodecane in the presence of a strong  
14    base such as butyllithium to produce the intermediate 5-  
15    hexadecyl-1-ol. This acetylenic alcohol is then reduced  
16    using deuterium gas in the presence of tris-(triphenyl-  
17    phosphoro)rhodium chloride as a catalyst to produce the  
18    corresponding saturated hexadecane-5,5,6,6-d<sub>4</sub>-1-ol OD.  
19    The resulting saturated alcohol is then oxidized in two  
20    stages using pyridinium chlorochromate to produce the  
21    desired specifically labelled palmitic-5,5,6,6-d<sub>4</sub> acid.

22                  In a second specific embodiment of the inven-  
23    tion, the desired acid is produced directly in a two-step  
24    sequence which comprises first contacting 1-decyne with  
25    6-bromo-hexanoic acid in the presence of butyl lithium to  
26    produce directly the acetylenic acid, 7-hexadecynoic acid,  
27    which is then converted directly to palmitic 7,7,8,8-d<sub>4</sub>  
28    carboxylic acid by treatment with deuterium gas and tris-  
29    (triphenylphosphoro)rhodium chloride as a catalyst.

1                   In a further specific embodiment of the present  
2 invention, palmitic-16,16,16-d<sub>3</sub> acid is prepared by first  
3 contacting 10-undecyn-1-ol tetrahydropyranyl ether with  
4 1-bromopentane-5,5,5-d<sub>3</sub> in the presence of butyl lithium  
5 to produce as a first intermediate, 10-hexadecyn-16,16,16-  
6 d<sub>3</sub>-ol and subsequently hydrogenating said decynol in the  
7 presence of tris-(triphenylphosphoro)rhodium chloride to  
8 produce the desired product.

9                   In a still further specific embodiment of the  
10 present invention, 10-undecyl-1-ol tetrahydropyranyl ether  
11 is alkylated using 1-bromobutane in the presence of butyl  
12 lithium to produce 10-pentadecyn-ol, which is converted  
13 to the tetradeutero compound pentadecan-1-ol 10,10,11,11-d<sub>4</sub>  
14 by treatment with deuterium gas in the presence of tris-  
15 (triphenylphosphoro)rhodium chloride as a catalyst. The  
16 said pentadecanol is then successively converted to the  
17 corresponding halo compound, 1-bromopentadecane-10,10,11,  
18 11-d<sub>4</sub> by treatment with triphenylphosphine and carbon  
19 tetrabromide, followed by metatheses of the bromopenta-  
20 decane with potassium cyanide to produce hexadecanitrile  
21 11,11,12,12-d<sub>4</sub> which in turn is hydrolyzed using 20% aqueous  
22 alcoholic sodium hydroxide solution to produce the desired  
23 palmitic-11,11,12,12-d<sub>4</sub> acid.

24                   The novel, specifically labelled fatty acids of  
25 the present invention are valuable compounds used in many  
26 kinds of specialized research work in addition to their  
27 utility for the same purposes as the commercially available  
28 palmitic acid. General applications include their use in  
29 the study of reaction mechanisms, as tracers in the study  
30 of separation processes, and as model compounds for investi-  
31 gation of the physical properties of labelled compounds.

1 They are also useful in the study of the naturally occurring  
2 ring unlabeled acids in biological systems, and as such  
3 may be employed in the clinical diagnosis of conditions  
4 which involve the production or abstraction of fatty acids.  
5 They are also useful in the study of the metabolism and  
6 biosynthesis of the corresponding unlabeled compounds.

1                   EXAMPLE 12                   Palmitic 5,5,6,6-d<sub>4</sub> Acid3    Step A: 4-Chlorobutanol tetrahydropyranyl ether

4

5                   A mixture of 4-chlorobutanol (21.7 g.) and p-  
 6    toluenesulfonic acid (250 mg.) in anhydrous ether is added  
 7    to dihydropyran (26 ml.) and the reaction mixture is stirred  
 8    at room temperature overnight. There is an initial mild  
 9    exothermic reaction. The solution is then diluted with  
 10   ether (200 ml.) and washed twice with 0.1 M sodium carbonate  
 11   solution, the ether layer containing the product is dried  
 12   with potassium carbonate and evaporated under reduced pres-  
 13   sure, leaving a residue containing 4-chlorobutanol tetra-  
 14   hydropyranyl ether. The residue is distilled, and the  
 15   fraction at 74-76°C./0.3 mm. Hg. is collected. Analytical  
 16   data, n.m.r., m, 1.27-2.0, 8H; m, 3.22-4.12, 6H; s, 4.58,  
 17   1H.

18   Step B: 5-hexyn-1-ol-tetrahydropyranyl ether

19

20                   Under a nitrogen atmosphere, and with stirring,  
 21    acetylene is introduced into dry tetrahydrofuran (150 ml.),  
 22    cooled, and maintained below 10°C., while butyl lithium  
 23    (150 ml. of a 2.4 M solution in hexane) is added dropwise.  
 24    After addition is complete, the mixture is matured for one  
 25    hour. A passage of acetylene gas through the mixture is  
 26    steadily maintained. A solution of 4-chlorobutanol tetra-

2 hydrotropyranyl ether (50 g.), in dry hexamethyl phosphoric  
 3 the temperature did not exceed 20°C. The reaction mixture  
 4 is stirred over night at room temperature; ice, then water,  
 5 is added to dilute the mixture to one litre, and the mix-  
 6 ture is extracted twice with ether. The ether solution is  
 7 backwashed with water, dried with potassium carbonate, and  
 8 evaporated under reduced pressure to produce a residue con-  
 9 taining 5-hexyn-1-ol-tetrahydropyranyl ether. The residue  
 10 is distilled, collecting the fraction at 66-69°C. (0.25 mm.  
 11 Hg.), containing principally 5-hexyn-1-ol-tetrahydropyranyl  
 12 ether, b.p. 67-68°C./0.25 mm. Hg. Gas chromatographic  
 13 analysis demonstrates that the product contains 58 unreacted  
 14 starting material—4-chlorobutanol tetrahydropyranyl ether.

15 Step C: 5-hexadecynyl-1-ol

16  $\text{CH}_3(\text{CH}_2)_9\text{C}=\text{C}(\text{CH}_2)_4\text{OH}$

17 under a nitrogen atmosphere, and with stirring  
 18 and cooling, butyl lithium (66 ml. of a 2.4 M solution in  
 19 hexane) is added to a solution of 5-hexyl-1-ol-tetrahydropyra-  
 20 pyranyl ether (30 g.) in dry tetrahydropyran (200 ml.),  
 21 at such a rate that the temperature remains below 10°C.  
 22 The reaction mixture is stirred at 10°C. for one hour,  
 23 then 1-bromodecane (36.3 g.) in dry hexamethyl phosphoric  
 24 triamide (120 ml.) was added at a rate such that the tem-  
 25 perature is maintained below 25°C. The reaction is stirred  
 26 at room temperature overnight under an atmosphere of nitro-  
 27 gen, then worked up by the addition of ice, then water, to  
 28 dilute the reaction to 700 ml., and is extracted twice with  
 29 ether. The combined ether extracts are washed several  
 30 times with water, dried over potassium carbonate, and

1	evaporated at reduced pressure. The residue is warmed at 50°C. for two hours in methanol (200 mL) containing p-
2	toluenesulfonic acid (250 mg). The methanolic solution is reduced to a quarter its volume, 0.1 M sodium carbonate solution is added to a quarter its volume. The methanolic solution is
3	backwashed with ether extract containing the product is washed, dried over magnesium sulfate, and evaporated under water, then extracted with 0.1 M sodium carbonate solution, then with hexane containing 3% ethyl acetate, concentrated 10% ethyl
4	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
5	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
6	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
7	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
8	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
9	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
10	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
11	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
12	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
13	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
14	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
15	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
16	acetate and finally 20% ethyl acetate, concentrated 10% ethyl
17	Step D: Hexadecane-5,5',6,6-d <sub>4</sub> -1-OH
18	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>9</sub> CD <sub>2</sub> (CH <sub>2</sub> ) <sub>4</sub> OH
19	The hydroxyl group of 5-hexadecyl-1-OH is ex-
20	changed by washing an etheral solution of the compound
21	several times with excess deuterium oxide. The recovered
22	5-hexadecyl-1-OH (16 g.), is dissolved in 500 mL of dry
23	oxygen-free toluene; and under an atmosphere of dry
24	tris-(triphenoxyphosphoro)iodium chloride (0.5 g.), is added
25	as a catalyst. The acetyllic compound is reduced with D <sub>2</sub>
26	gas at 1 atmosphere pressure, taking up the calculated
27	volume of deuterium. The toluene solution is evaporated
28	under reduced pressure; the residue is evaporated with

1 several times; and combined extracts are filtered and evap-  
2 orated to dryness. The residue is distilled 125-120°C.  
3 (0.2 mm. Hg.), giving 14 g. of product.

4 Step E: Hexadecanal-5,5,6,6-d<sub>4</sub>

6 In an appropriate flask fitted with a reflux  
7 condensor is suspended 8.4 g. (86 mmole) of pyridinium  
8 chlorochromate prepared as described in E. J. Corey and  
9 J. William Suggs Tetrahedron Letters, p. 2647 (1975), in  
10 100 ml. anhydrous methylene chloride. A solution of  
11 hexadecane-5,5,6,6-d<sub>4</sub>-1-ol (14 g., 57 mmole) in 20 ml.  
12 methylene chloride is added in one portion to the stirred  
13 solution. After 1.5 hours, 100 ml. of dry ether is added  
14 and the supernatant decanted from the black gum, which  
15 separates from the reaction mixture. The insoluble resi-  
16 due is then washed thoroughly three times with 50 ml.  
17 portions of anhydrous ether; whereupon the insoluble black  
18 gum residue becomes a black granular solid. The decanted  
19 supernatant solution is combined with the ether extracts  
20 containing the product and passed through a filter pad;  
21 and the solvent is removed by distillation under reduced  
22 pressure, leaving the product as a residual oil. The  
23 product is purified by distillation at 115-120°C. (0.15  
24 mm.), thereby providing substantially pure hexadecanal-  
25 5,5,6,6-d<sub>4</sub>, b.p. 115-120°C./0.15 mm. Hg. The undistilled  
26 residue comprising principally palmitoyl 5,5,6,6-d<sub>4</sub>-palmi-  
27 tate 5,5,6,6-d<sub>4</sub> is recycled by reduction of the ester with  
28 lithium aluminum hydride in ether to the starting material,  
29 hexadecanol-5,5,6,6-d<sub>4</sub>.

1 Step E: Palmitic-5,6-*d*<sub>4</sub> Acid

2  $\text{CH}_3(\text{CH}_2)_9\text{CD}_2(\text{CH}_2)_3\text{COOH}$

3 To a stirred, cooled suspension of hexadecanal

4 5,5',6,6-*d*<sub>4</sub> (7.5 g.) in 100 mL of acetic acid is added,

5 dropwise, chromic acid (4.07 g.) in water (10 mL) over a

6 period of 45 minutes. The temperature is maintained below

7 55°C. The reaction is stirred for a further hour, diluted

8 with  $\text{H}_2\text{O}$  to 500 mL, and extracted with ether (3 x 150 mL).

9 The combined ether extracts are washed with  $\text{H}_2\text{O}$  (5 x 200

10 mL), dried over magnesium sulfate, and evaporated. Residual

11 acetic acid is removed by distillation 154-157°C.

12 The crude acid is purified by distillation with toluene.

13 (0.15 mm.) and crystallization from petroleum ether (30-

14 60°C.) at low temperature to afford subsantially pure

15 palmitic-5,5',6-*d*<sub>4</sub> acid, m.p. 63°C (lit 63°C. of the

16 corresponds to light palmitic acid). Mass spectrum

17  $M^+ = 260$  ( $\text{d}_4$ ) = 96.95%, 259 ( $\text{d}_3$ ) = 3.05%; (98.98 atom %).

18 EXAMPLE 2

19 Palmitic 7,7',8,8-*d*<sub>4</sub> Acid

20 Step A: 7-Hexadecenoic Acid

21  $\text{CH}_3(\text{CH}_2)_7\text{C}\equiv(\text{CH}_2)_5\text{COOH}$

22 A solution of 7-decyn (14 g.) in dry tetrahydrofuro-

23 furan (40 mL) is cooled in an atmosphere of nitrogen to

24 40°C. Butyllithium (45 mL. of 2.4 M solution) in hexane

25 is added at such a rate that the internal reaction tempera-

26 ture does not exceed 10°C. When addition is complete, the

1 solution of 1-lithiodecyne is matured for one hour at 5-  
2 10°C.; and the 6-bromo-hexanoic acid in 40 ml. of dry hexa-  
3 methyl phosphonic triamide is added at a rate such that  
4 the reaction does not go above 25°C. After addition is  
5 complete, the reaction is stirred at room temperature over-  
6 night. The reaction mixture is diluted with ice and water,  
7 acidified to pH 2, and extracted with ether. The combined  
8 ether extracts are backwashed with  $H_2O$ , dried over magnesium  
9 sulfate, and evaporated under reduced pressure. The residue  
10 containing the product is distilled. The first fraction  
11 is reasonably pure, unreacted 1-decyne (~8 g.), then the  
12 temperature rises over a few minutes to 155°C. at 0.1 mm.  
13 The product is then recovered substantially pure as an oil.

14 Step B: Palmitic-7,7,8,8-d<sub>4</sub> Acid

16 The 7-hexadecynoic acid is converted to the methyl  
17 ester with methanol and hydrogen chloride. The ester is  
18 reduced in a manner analogous to the reduction of 5-hexa-  
19 decyn-ol as described in Example 1, Step D. The recovered  
20 methyl palmitate 7,7,8,8-d<sub>4</sub> is converted to the acid by  
21 hydrolysis with sodium hydroxide in aqueous methanol. The  
22 acid is crystallized from petroleum ether at low tempera-  
23 ture; m.p. 63-63°C.

24 EXAMPLE 3

25 Palmitic 16,16,16-d<sub>3</sub> Acid

26 Step A: 10-Undecyn-1-ol tetrahydropyranyl ether

28 10-undecynoic acid is reduced with lithium

1 aluminum hydride in ether, by standard procedures, to the  
2 10-undecyn-1-ol. The 10-undecyn-1-ol is converted to its  
3 tetrahydropyranyl ether by a method analogous to that de-  
4 scribed above from 4-chlorobutanol (Example 1, Step A).

5 Step B: 1-bromopentane 5,5-d<sub>3</sub>

7 Ethyl-2,2,2-d<sub>3</sub> bromide (45 g.) is added dropwise  
8 to a cooled, stirred suspension of Mg. (9.35 g.) in 200 ml.  
9 of anhydrous ether. After the Grignard reagent has formed,  
10 trimethylene oxide (27 g.) in anhydrous ether (60 ml.) is  
11 added over 2-3 minutes. The reaction mixture is refluxed  
12 for one hour, then dry benzene is added slowly while the  
13 ether is distilled out. After all ether has been replaced  
14 with benzene, the reaction is refluxed for a further 3  
15 hours. Saturated ammonium chloride solution is then added  
16 slowly to the cooled reaction mixture. The mixture, after  
17 acidification with hydrochloric acid solution, is extracted  
18 with ether (4 X 100 ml.); the combined extracts are dried  
19 over magnesium sulfate and evaporated under reduced pres-  
20 sure until most of the ether is removed. The residue is  
21 distilled through a Vigreux column, and two major fractions  
22 are collected. The first at  $\sim 60^{\circ}\text{C}.$ , the second at 134-  
23 140 $^{\circ}\text{C}.$  The second fraction is crude 1-pentanol (14 g.).

24 A mixture of the above product, triphenylphos-  
25 phene (45.2 g.), and dimethylformamide is treated with  
26 bromine until the orange colour persists. The reaction  
27 is stirred for a further hour, and the volatile material,  
28 including dimethyl formamide, is removed under reduced

1 pressure. To the distillate is added H<sub>2</sub>O (600 ml.). The  
2 lower layer is carefully separated, backwashed twice with  
3 water, dried over magnesium sulfate, and filtered. The  
4 magnesium sulfate is extracted twice with ether, and the  
5 combined washings and product layer are combined and dis-  
6 tillied. Pure 1-bromopentane 5,5,5-d<sub>3</sub> is obtained. Single  
7 peak by g.c.

8 Step C: 10-Hexadecyn-16,16,16-d<sub>3</sub>ol

10 Using 10-undecyn-1-ol tetrahydropyranyl ether  
11 (34.5 g.) and 1-bromopentane 5,5,5-d<sub>3</sub> (35 g.), 10-hexa-  
12 decyn-1-ol-16,16,16-d<sub>3</sub> is prepared in a manner analogous  
13 to that described for 5-hexadecyn-1-ol (Example 1, Step C).  
14 The product is partially separated from the major impurity  
15 10-undecyn-1-ol by column chromatography and used in the  
16 next step without further purification.

17 Step D: Hexadecan-1-ol 16,16,16-d<sub>3</sub>

19 The crude 10-hexadecyn-1-ol 16,16,16-d<sub>3</sub> obtained  
20 above is reduced with H<sub>2</sub> in the presence of tris-(triphenyl-  
21 phosphoro)-rhodium chloride as described for 5-hexadecyn-  
22 1-ol. The crude recovered product is carefully distilled,  
23 giving pure hexadecan-1-ol 16,16,16-d<sub>3</sub>; b.p. 115-118°C./  
24 0.15 mm. Hg.

1    Step E: Palmitic 16,16,16-d<sub>3</sub> Acid

3                    The hexadecan-1-ol 16,16,16-d<sub>3</sub> is oxidized in  
 4    two steps using pyridinium chlorochromate then chromic  
 5    acid in acetic acid as described for hexadecan-1-ol 5,5,  
 6    6,6-d<sub>4</sub> (Example 1, Steps E and F), to give, after the same  
 7    purification procedure, palmitic 16,16,16-d<sub>3</sub> acid; m.p.,  
 8    63°C.

9                    EXAMPLE 410                    Palmitic 11,11,12,12-d<sub>4</sub> Acid11    Step A: Pentadecan-1-ol 10,10,11,11-d<sub>4</sub>

13                    Pentadecan-1-ol 10,10,11,11-d<sub>4</sub> is prepared in  
 14    an exactly analogous manner to hexadecan-1-ol 16,16,16-d<sub>3</sub>  
 15    (described in Example 3), except 1-bromobutane is used in  
 16    place of 1-bromopentane 5,5,5-d<sub>3</sub> and deuterium is used in  
 17    place of hydrogen in the reduction step.

18    Step B: 1-Bromopentadecane 10,10,11,11-d<sub>4</sub>

20                    Triphenylphosphine (11.3 g.) is added to a mix-  
 21    ture of ether (80 ml.), carbon tetrabromide (14.3 g.), and  
 22    pentadecan-1-ol 10,10,11,11-d<sub>4</sub>; and the reaction mixture  
 23    is then refluxed. The progress of the reaction is moni-  
 24    tored by gas chromatographic analysis of aliquots taken  
 25    from the reaction mixture. After five hours, the reaction

1 is complete. Solvent is removed under reduced pressure,  
 2 and the residue filtered through a column of silica gel,  
 3 eluting with hexane. The product is collected and distilled  
 4 to give substantially pure 1-bromopentadecane 10,10,11,11-d<sub>4</sub>  
 5 (~130°C./0.2 mm. Hg.).

6 Step C: Hexadecanitrile 11,11,12,12-d<sub>4</sub>

8 A mixture of 1-bromopentadecane 10,10,11,11-d<sub>4</sub>  
 9 (5.9 g.), potassium cyanide (2.6 g.), and ethanol (60 ml.)  
 10 are refluxed. The reaction is monitored by t.l.c. (thin  
 11 layer chromatography). After refluxing overnight, the  
 12 reaction is complete. The reaction is cooled, evaporated  
 13 to a small volume, diluted with ether, and washed with  
 14 0.1 M sodium hydrogen carbonate solution, and extracted  
 15 with ether. The ether solution is dried and evaporated,  
 16 leaving hexadecanitrile 11,11,12,12-d<sub>4</sub> as a product, which  
 17 is identified by n.m.r.  $\text{CDCl}_3$ , t, 3H, 0.88; m, 1.28, 22H;  
 18 t, 2H, 2.30, and i.r. [C-D, 2090  $\text{cm}^{-1}$ , 2190  $\text{cm}^{-1}$ ].

19 Step D: Palmitic-11,11,12,12-d<sub>4</sub> Acid

21 Hexadecanitrile 11,11,12,12-d<sub>4</sub> (4.8 g.) is com-  
 22 bined with 20% sodium hydroxide solution (20 ml.) and  
 23 ethanol (100 ml.) and refluxed for 16 hours. All nitrile  
 24 is consumed by the procedure as demonstrated by t.l.c.  
 25 The mixture is carefully acidified with aqueous hydrochloric  
 26 acid. The ethanol is largely removed by evaporation at  
 27 reduced pressure, and the mixture is extracted with ether.

- 1 The ether solution is washed once with water, dried over magnesium sulphate, and evaporated. The acid product is crystallized at low temperature from petroleum ether (30-  
60°C.), m.p. 62-63°C.

WHAT IS CLAIMED IS:

1. A process for the preparation of specifically labelled fatty acids which comprises the steps of alkylating a terminal acetylene substituent in an aliphatic compound having a carboxyl substituent or a functional substituent convertible to carboxyl and subsequently hydrogenating or deuterogenating said acetylenic substituent to produce a specifically labelled fatty acid or compound readily convertible thereto.

2. A process according to Claim 1 which comprises conducting the hydrogenation or deuterogenation reaction in the presence of a catalyst which is soluble in the reaction mixture.

3. A process according to Claim 2 wherein the catalyst is tris-(triphenylphosphoro)rhodium chloride.

4. A process according to Claim 1 which comprises the steps of alkylating a terminal acetylene substituent in an alkynoic acid and subsequently deuterogenating said acetylenic substituent to produce a tetra-deuterated aliphatic carboxylic acid.

5. A process according to Claim 1 which comprises the steps of alkylating the terminal acetylene substituent in an alkyn-1-ol, subsequently deuterogenating said alkylated alkyn-1-ol, to produce the corresponding tetradeuterated alkan-1-ol and converting said alkanol by known means to the corresponding tetradeuterated aliphatic carboxylic acid.

6. A process according to Claim 1 which comprises the steps of alkylating a terminal acetylene substituent in an alkyn-1-ol by treatment with a deutoeroalkyl halide in the presence of butyl lithium to produce a deutoeroalkylalkyn-1-ol, subsequently hydrogenating said deutoeroalkylalkyn-1-ol to produce the corresponding deutoero- alkanol and converting said alkanol by known means to a specifically deuterated aliphatic carboxylic acid.

7. A process according to Claim 1 which comprises contacting 5-hexyn-1-ol tetrahydropyranyl ether with 1-bromodecane in the presence of butyl lithium to produce 5-hexadecyn-1-ol and subsequently contacting said hexadecynol with deuterium gas in the presence of tris-(triphenylphosphoro)rhodium chloride to produce hexadecane 5,5,6,6-d<sub>4</sub>-1-ol and subsequently converting said hexadecanol by known means to palmitic-5,5,6,6-d<sub>4</sub> acid.

8. A process according to Claim 1 which comprises contacting 1-decyne with 6-bromohecanoic acid in the presence of butyl lithium to produce 7-hexadecynoic acid and subsequently contacting said hexadecynoic acid with deuterium in the presence of tris-(triphenylphosphoro)rhodium chloride to produce palmitic-7,7,8,8-d<sub>4</sub> acid.

9. A process according to Claim 1 which comprises contacting 10-undecynol tetrahydropyranyl ether with 1-bromopentane-5,5,5-d<sub>3</sub> in the presence of butyl lithium to produce 10-hexadecyn-1-ol 16,16,16-d<sub>3</sub> and subsequently

-21-

15. Palmitic 11,11,12,12-d<sub>4</sub> acid.

14. Palmitic 16,16,16-d<sub>3</sub> acid.

13. Palmitic 7,7,8,8-d<sub>4</sub> acid.

12. Palmitic 5,5,6,6-d<sub>4</sub> acid.

11,11,12,12-d<sub>4</sub> acid.

7,7,8,8-d<sub>4</sub> acid, palmitic 16,16-d<sub>3</sub> acid, and palmitic bound selected from palmitic 5,6,6-d<sub>4</sub> acid, palmitic bromopentadecane with potassium cyanide to produce hexadecanitride 11,11,12,12-d<sub>4</sub>, and hydrolyzing said to produce palmitic-11,11,12,12-d<sub>4</sub> acid.

11. A specifically deuterated fatty acid com-  
pound selected from palmitic 5,6,6-d<sub>4</sub> acid, palmitic bromopentadecane with potassium cyanide to produce hexadecanitride 10,10,11,11-d<sub>4</sub>, contacting said compound 1-bromopentadecane 10,10,11,11-d<sub>4</sub>, contacting said pentadecanol by bromination to the corresponds converting said pentadecanol by bromination to the corresponds iodium chloride to produce pentadecan-1-ol 10,10,11,11-d<sub>4</sub>, deuterium gas in the presence of tri-<sub>2</sub>-triphenylphosphoro- and subsequently contacting said pentadecan-1-ol with and subsequently contacting said pentadecan-1-ol with the presence of butyl lithium to produce 10-pentadecen-1-ol processes contacting 10-undecen-1-ol with 1-bromoobutane in 10. A process according to claim 1 which com-  
bines known means to palmitic-16,16,16-d<sub>3</sub> acid.

hexadecan-1-0-1-16,16,16-d<sub>3</sub> and converting said hexadecanol of tri-<sub>2</sub>-triphenylphosphoro-iodidium chloride to produce contacting said hexadecanol with hydrogen in the presence
